Gaultheria

the autumn beauty

partridge @Simon002

Gaultheria procumbens is one of the most popular crop for autumn planting in Europe.

Originating from North America and growing wild in the woods, it is also called false berry, red partridge berry, carpet berry or wintergreen and is an ideal companion in bedding and balcony plantings and as an evergreen ground cover. In autumn and winter, the hardy ornamental shrub shows its best side and then forms strikingly decorative, pearl-like capsule fruits. The minty, fresh-tasting fruits are largely inedible and slightly poisonous but were formerly used as a natural flavouring for chewing gum.

Some years ago, Bock started targeted breeding activities to improve this berry-bearing cultivar. With this catalogue we present the results: Strong and healthy new varieties, uniformly programmable and with many large fruits. The many years of breeding selection, crossing, cloning and development of a vegetative in vitro

propagation protocol have resulted in eight attractive clones and four different colours of fruit decoration: white, pink, bright red and burgundy.

Delight your customers with this autumn assortment. Guarantee a colourful garden season in autumn and winter, outside the normal season, with first-class quality. Especially in the snow, the varied fruiting of the compact false berry, which belongs to the heather family, forms a wonderful colour contrast.

Why propagate gaultheria in vitro? sterile guarantee

In recent years, especially in young plant nurseries, there have been enormous failures and even collapses of entire stands. The plants show symptoms such as leaf and stem lesions, individual shoots dried up. This leads to plant death.

The causative agent is a fungus that occurs worldwide and attacks crops such as blueberries, citrus fruits and coffee as well as Gaultheria. This fungus is seed-transmissible and survives on plant residues. Spread of the pathogen can only be prevented with the use of chemical plant protection products. In older stands, these measures are only prophylactic, as the fungus is mainly found in the lower stem area.

Without in vitro propagation in the sterile tissue culture laboratory, the beautiful Gaultheria would already be extinct.

Bock is an expert in the field of in vitro and horticultural propagation of plants of all kinds. With vegetative plant propagation, Bock produces pure varieties with a germ-free and first-class quality.

Let yourself be inspired by the wonderful shrub varieties presented on the following pages, treasures from the forests of nature, winter-hardy and disease-free.
