# saxifraga

versatile bright beauties bring light into autumn

In October and November, the autumn saxifrage (*Saxifraga cortusifolia*) with its filigree, fragrant flowers in bright colours conquers the hearts of those who want to prolong the summer a little.

The perennial, hardy plant loves semi-shady to shady spots. This decorative perennial has fine star-shaped flowers and a very pleasant fragrance. Flowering in October and November, the white, pink or vibrant pink flowers are a beautiful addition to any shady garden area at a time of year when few species flower, and also make excellent houseplants. In pots of 9-17 cm (3.5-6.7 inch) they will flower for weeks even in heated rooms and can later be planted in the garden. This versatility allows them to be marketed both as perennials and as houseplants. Some years ago, Bock started targeted breeding activities to improve this autumn-flowering, Japanese beauty.

With this catalogue we present the results:

Bock Bio Science offers a colourful assortment of hardy varieties propagated in tissue culture. The plants are tested for all relevant viruses, which enables uniform cultivation. The flowering time can then be successfully controlled by the culture management.

The autumn-flowering *Saxifraga cortusifolia* clone assortment from Japan is a unique niche assortment with great development potential. The delicate and fragrant flowers also last a long time as cut flowers. In the pot, the varieties are compact to lush, depending on the time of cultivation. The culture including the flowering is fully programmable. A sale in spring due to the beautiful leaves as planting material is also successful. We sell effectively with Japanese-style labels.

## why in vitro propagation of saxifraga?

The propagation of Saxifraga is anything but easy if you want to get uniform offspring from a variety. Propagation by division is inefficient and by seed does not give uniform plants or cannot be done, as many cultivars are infertile.

The advantage of vegetative propagation in vitro is that beautifully selected individual plants of absolutely identical, healthy quality can be obtained in high numbers. This way, you as a producer can start your culture with healthy

growing starting material and know what the variety will look like when it is ready; in planned culture to the exact moment, programmable and uniform.

Delight your customers with this decorative assortment. Guarantee an extra-seasonal range of colourful beauties in autumn with first-class quality, especially suitable for modern garden concepts and plantings indoors and outdoors.
